Summary

- **Climate:** over the last week, only the far north coast received any rainfall and this just a light drizzle. For March, most of the state had below average rainfall with only a pocket of the mid-north coast had above average precipitation.
- **Three Month Forecast:** rainfall predictions for NSW are for average precipitation for most of the state, with a slight chance of exceeding the average for the far south coast. Maximum and minimum temperatures are expected to be around average, although minimum temperatures are predicted to be above average along the Murray. According to the BOM as 10/Apr/2018, the El Niño–Southern Oscillation remains neutral.
- **Tidal:** the next series of tides that may trigger *Aedes vigilax* hatching are due over 16-22/Apr with tides of up to 1.86m predicted.
- **MVEV models:** the data relevant to both the Forbes’ and Nichols’ hypotheses have been updated to the end of Mar 2018. Neither model are suggestive of an MVEV epidemic.
- **Mosquito Numbers Inland:** all inland surveillance activities have ceased for this season.
- **Mosquito Numbers Coast:** collections were ‘high’ from almost all trapping sites, with few *Aedes vigilax* collected this week.
- **Mosquito Numbers Sydney:** mosquito numbers were down this week, although Homebush Bay continues to produce ‘high’ numbers.
- **Arboviral Isolates:** there were no further arboviral detections this week.
- **Chicken Sentinel Flocks:** all inland surveillance activities have ceased for this season.
- **Human Notifications:** for the current fiscal year, there have been 368 RRV and 74 BFV notifications, this is below the average compared with past years (the prior 18 season averages to the end of March are 406RRV and 240BFV).

Comment: Over the last week temperatures have been above average by up to 10 degrees for large parts of the state and this can only prolong the mosquito season. In fact, mosquito numbers remain ‘high’ at many sites along the coast. This coincides with the school holidays next week, when people are more likely to be outdoors and exposed to mosquitoes. For the coast, this time of the year is typically when peak virus transmission occurs and we can expect human notifications to go up, with the elevated mosquito numbers.

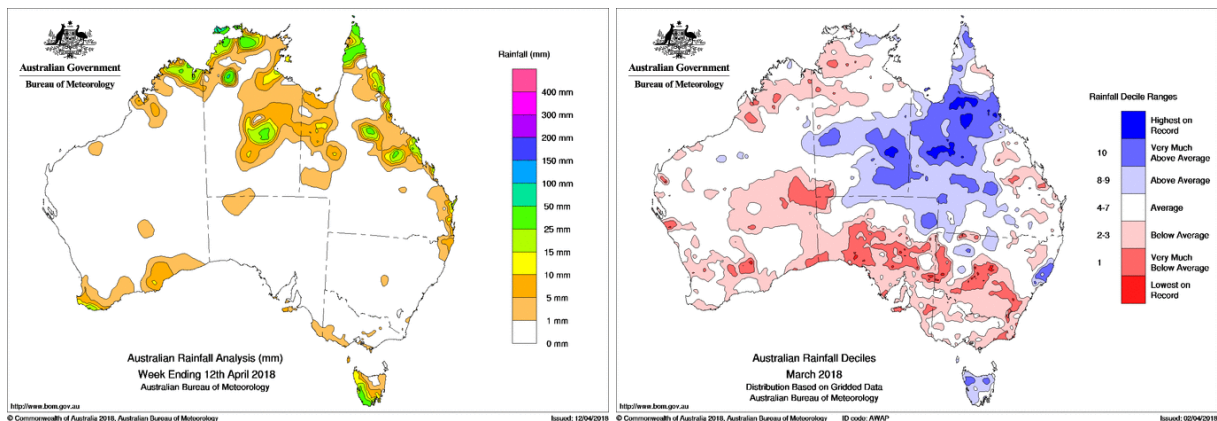

Holiday-makers enjoying outdoor activities, particularly camping and fishing, should cover-up and use insect repellent containing Diethyl Toluamide (DEET) or Picaridin. The NSW Health factsheet on avoiding mosquito bites is available at:

<http://www.health.nsw.gov.au/environment/factsheets/Pages/mosquito-bite-avoidance.aspx>

Environmental Conditions

Rainfall

Rainfall across Australia for the week ending 12/Apr/2018 is depicted on the left and monthly rainfall deciles for March 2018 are on the right. Over the last week, there has been no rainfall for the majority of the state, with only a drizzle in the far north coast. For March, rainfall was below to very much below average across southern inland regions and around average for the remainder of the state. Only a pocket of the mid-north coast had above average precipitation. Maximum and minimum temperatures for March were 1-2 degrees above average.

Three Month Rainfall & Temperature Forecast

For May to July 2018, rainfall predictions for NSW are for average precipitation for most of the state, with a slight chance of exceeding the average for the far south coast. Maximum and minimum temperatures are expected to be around average, although minimum temperatures are predicted to be above average along the Murray. The following pages contain graphics of the seasonal outlook:

www.bom.gov.au/climate/outlooks/#/rainfall/median (Rainfall outlook).

www.bom.gov.au/climate/outlooks/#/temperature/summary (Max & min temperature outlook).

According to the BOM as of 10/Apr/2018, the El Niño–Southern Oscillation remains neutral. The Indian Ocean Dipole (IOD) remains neutral. This all suggests that rainfall patterns are likely to be average over the upcoming months.

For more information: www.bom.gov.au/climate/enso/ and, <http://www.bom.gov.au/climate/iod/>

Tidal

Tidal information is relevant for the prediction of the activity of the salt marsh mosquito, *Aedes vigilax*. Typically for NSW, tides of over 1.8m, as measured at Sydney, can induce hatching of *Aedes vigilax* larvae and the graph below of predicted tide heights can provide some indication of when this is likely to occur. Note this height varies between regions, thus at Batemans Bay, a tide height over 0.8m can trigger egg hatching.

The next series of tides that may trigger *Aedes vigilax* hatching are due over 16-22/Apr with tides of up to 1.86m predicted.

Note that actual tide heights can vary by 0.3m (or more in unusual circumstances) due to variations in atmospheric pressure, rainfall, wind and other climatic phenomena. Climate change will also result in much higher tide heights. Thus predicted tide height should be used as a gauge only for potential *Aedes vigilax* activity. The larvae of the saltmarsh mosquito relies on a inundation/drying cycle for the mudflats in which it lives; continual wet weather prevents the drying cycles thereby reducing larval production.

MVEV Climatic Models

Three predictive environmental based models for MVEV activity have been developed; the Forbes (which relies on rainfall in the river catchment basins of Eastern Australia), Nichols (based on the Southern Oscillation), and the Bennett theory (based on the Indian Ocean Dipole). The latter theory is poorly developed (and unreliable), and is not considered below. Note that all the predictive models have been developed on a limited data set and do not always forecast activity. There can also be unusual environmental conditions that may lead to the introduction of the virus to southeastern Australia, such as the movement of low pressure cells from the north to the south of the country during 2008 and 2011. Vertical transmission of the virus (from adult to the egg in *Aedes* species) can result in restricted activity following localized heavy precipitation (as per 2003 at Menindee).

i. Forbes' Hypothesis

Rainfall was not above Decile 7 in all of the river catchment basins in eastern Australia for the last quarter of 2016, the first quarter of 2017, the last quarter of 2017 or the first quarter of 2018 (Table 1).

Table 1. Rainfall indices for the main catchment basins of eastern Australia as per Forbes' hypothesis, relevant to the 2017-2018 season. Note that a value of 1 equals Decile 7 rainfall.

Catchment Basin	Oct-Dec 2016	Jan-Mar 2017	Oct-Dec 2017	Jan-Mar 2018
Darling River	0.58	0.81	0.93	0.52
Lachlan/Murrumbidgee/Murray Rivers	0.92	1.01	1.15	0.70
Northern Rivers	0.98	1.03	0.81	1.07
North Lake Eyre system	1.09	0.73	0.75	0.69

ii. Nichol's Hypothesis

Table 2. The seasonal atmospheric pressures (in mm) according to Nichol's hypothesis, relevant to the 2017-2018 season.

	Autumn 2017	Winter 2017	Spring 2017
2017 Value	1009.60	1013.23	1009.70
Pre past MVEV seasons	<1009.74	<1012.99	<1009.99

Only the Winter period pertaining to the Nichol's hypothesis is not in line with past MVEV active years.

Arboviral Isolates

LOCATION - Site	Date Trapped	Mosquito Species	Virus
GRIFFITH – Lake Wyangan	3/Jan/2018	<i>Culex annulirostris</i>	Ross River
GEORGES RIVER - Deepwater	30/Jan/2018	*	Stratford
GRIFFITH – Lake Wyangan	31/Jan/2018	<i>Culex annulirostris</i>	Ross River
GRIFFITH – Hanwood	5/Feb/2018	<i>Culex annulirostris</i>	Ross River
GEORGES RIVER – Alfords Point	7/Feb/2018	*	Stratford
GEORGES RIVER - Deepwater	12/Feb/2018	<i>Aedes vigilax</i>	Stratford
CENTRAL COAST – Empire Bay	27/Feb/2018	*	Barmah Forest
CENTRAL COAST – Halekulani	14/Mar/2018	*	Barmah Forest
GEORGES RIVER – Alfords Point	21/Mar/2018	*	Barmah Forest
GEORGES RIVER – Deepwater	21/Mar/2018	*	Barmah Forest

*Detection via PCR on pooled samples; the mosquito species cannot be determined.

Human Notifications

Weekly notifications of human mosquito-borne diseases infections are available from the NSW Ministry of Health, Communicable Disease Weekly Report and summarized in the Table below* (www.health.nsw.gov.au/Infectious/reports/Pages/CDWR.aspx).

Table 4. Notifications of Mosquito-Borne Disease in NSW, 2017-2018*

Week Ending	RRV	BFV	DENV [†]	Malaria [†]	CHIKV [†]	ZIKV [†]	Total
1-Jul-17	14	6	3	2	0	0	25

18-Nov-17	3	2	10	0	0	0	15
25-Nov-17	9	2	6	1	1	0	19
2-Dec-17	14	1	8	0	0	0	23
9-Dec-17	9	0	3	1	0	0	13
16-Dec-17	9	4	2	1	2	0	18
23-Dec-17	7	0	6	0	0	0	13
30-Dec-17	5	0	1	0	0	0	6
Total	238	39	105	33	17	1	433

[†]All of these viruses are acquired overseas, although some DENV cases may be from North Queensland.

*The data in this table is updated once available from the NSW Ministry of Health.

Comment: It should also be noted that notifications are for NSW residents and that infection may have been acquired elsewhere and that winter notifications of RRV are likely to be false positives.

Table 4 cont. Notifications of Mosquito-Borne Disease in NSW, 2017-2018*
