FOREWORD	3
ACKNOWLEDGEMENTS	4
INTRODUCTION	5
METHODS	6
HEALTH BEHAVIOURS	9
Alcohol and cannabis	
Risk alcohol drinking	11
High risk alcohol drinking	13
Injury prevention	
Homes with a smoke alarm or detector	15
Nutrition	
Recommended fruit consumption	17
Recommended vegetable consumption	19
Usual use of low fat milks	21
Eating potato crisps or salty snacks less than once a month	23
Eating breads and cereals once a day or more	25
Eating processed meat products less than 3 times a week	27
Physical activity	
Adequate physical activity	29
Smoking	
Current smoking	31
Smoke-free households	33
Smoke-free cars	35
HEALTH STATUS	37
Self-rated health	
Excellent, very good, or good self-rated health status	39
Asthma	
Ever diagnosed with asthma	41
Current asthma	43
Cardiovascular disease precursors	
Blood pressure measured in last 2 years	45
High blood pressure	47
Cholesterol measured in last 2 years	49
High cholesterol	51
Diabetes or high blood glucose	
Diabetes or high blood glucose	53
Mental health	
High and very high psychological distress	55
Oral health	
Visited a dental professional in the last 12 months	57
Overweight and obesity	
Overweight and obesity	59
Obesity	61
HEALTH SERVICES	63
Health service use and access	
Private health insurance	64
Difficulties getting health care when needing it	66
Emergency department presentations	
Emergency department presentation in the last 12 months	68
Hospital admissions	
Hospital admission in the last 12 months	70
General practitioner services	
Visited a general practitioner in the last 2 weeks	72

Visited a general practitioner in the last 12 months	74
Public dental services	
Public dental service attendance in the last 12 months	76
Community health centres	
Community health centre attendance in the last 12 months	78
SOCIAL CAPITAL	80
Attended a community event at least once in the last 6 months	81
Helped out any local group or organisation at least once in the last 3 months	83
Active member of a local organisation, church or club	85
Most people can be trusted	87
Feel safe walking down their street after dark	89
Area has a reputation for being a safe place	91
Visit neighbours	93
Run into friends and acquaintances when shopping in local area	95
Sad to leave neighbourhood	97
CONCLUSION	99
Health behaviours	101
Health status	103
Health services	105
Social capital	106

Foreword

I am pleased to present the *1997-2007 Report on adults aged 16-24 years* from the New South Wales Population Health Survey, which provides information on the health of this important population group.

The report presents information on health behaviours, including: alcohol, fire safety in the home, nutrition, adequate physical activity, current smoking, smoke-free households, and smoke-free cars. This is followed by a chapter on health status, including: self-rated health, asthma, cardiovascular disease precursors (blood pressure and cholesterol), diabetes or high blood glucose, mental health (psychological distress), oral health, and overweight or obese. Next there is a chapter on health services including: private health insurance, difficulties getting health care, emergency department presentations, hospital admissions, general practitioner services, public dental services, and community health centres. Finally, there is a chapter on social capital, including: participation in the local community, trust and safety, and reciprocity and neighbourhood connectedness.

In the PDF version of the report, indicators are presented for males and females by quintile of socioeconomic disadvantage and by region (urban or rural health areas). Further information is presented in the HTML version. Both the PDF and HTML versions can be obtained from the New South Wales Population Health Survey website at www.health.nsw.gov.au/public-health/survey/hsurvey.html.

This is a descriptive report and there is a wealth of information in the survey dataset that may be of specific interest. For these reasons we encourage as many people as possible to analyse the data further. For further analysis within a health area, data can be accessed through the Health Outcomes Information Statistical Toolkit (HOIST). For further analysis among health areas, or at a statewide level, a data request needs to be lodged with the NSW Department of Health.

Comments on the New South Wales Population Health Survey are welcome.

I thank all the individuals and organisations who contributed their time and expertise to assist with the development and conduct of the Survey between 1997 and 2007.

Kerry Chant

Acting Chief Health Officer and Deputy Director-General, Population Health
July 2008

Introduction

Young adulthood involves exploration of and steps toward independence, with varying levels of adult supervision, making this period unique in the lifespan. Two important contextual influences shape the health of young adults: a prolonged transition to adult roles and responsibilities, and the weakening of the safety net that supports adolescents and younger children.[1] These factors have important implications for health behaviours, health status, health service use and access, and social capital.

Australian governments at the state and commonwealth levels recognise that research efforts need to increase if the full health potential throughout the lifespan is to be realised. While there are data sources that provide information on the health of people aged 16-24 in Australia, including national and state health surveys, health studies, and administrative data collections, there is considerable potential for further analyses of these data sources.

Since 2001, the Australian Bureau of Statistics has conducted a triennial National Health Survey. Before that time, surveys were conducted in 1989-90 and 1995. Information on the survey's probabilistic sampling and calculation of prevalence estimates can be found elsewhere.[2]

The New South Wales Population Health Survey is a continuous survey using computer assisted telephone interviewing (CATI). The survey covers the whole state population from birth upwards. The target sample is 12,000 persons a year.[3] Over the period 1997-2007, the total sample was 102,651 persons, of which 9,465 were aged 16-24 years.

This reports presents trends in the health of persons aged 16-24 years from the 1997-2007 New South Wales Population Health Survey. The health behaviours chapter includes: alcohol, fire safety in the home, nutrition, adequate physical activity, current smoking, smoke-free households, and smoke-free cars. This is followed by a chapter on health status, including: self-rated health, asthma, cardiovascular disease precursors (blood pressure and cholesterol), diabetes or high blood glucose, mental health (psychological distress), oral health, and overweight or obese. Next there is a chapter on health services including: private health insurance, difficulties getting health care, emergency department presentations, hospital admissions, general practitioner services, public dental services, and community health centres. Finally, there is a chapter on social capital, including: participation in the local community, trust and safety, and reciprocity and neighbourhood connectedness.

The health indicators in these chapters are presented in graphical and tabular form. Each indicator includes line graphs for socioeconomic status and region (urban or rural health areas). The table below the graph presents prevalence estimates for males, females and persons and includes the 95% confidence intervals (CI), which provides a range of values that contain the actual value 95% of the time. A wider confidence interval reflects less certainty in the estimate. If confidence intervals do not overlap then the observed estimates are significantly different. If confidence intervals overlap slightly the observed estimates may be significantly different but further testing needs to be done to establish that significance.

This report is available in PDF and HTML versions, which can be downloaded from the New South Wales Population Health Survey website at www.health.nsw.gov.au/publichealth/surveys/index.asp. Further information about the New South Wales Population Health Survey, including previous survey results and methods, can be obtained from the website.

Methods

The New South Wales Population Health Survey uses random digit dialling to contact households with private telephones. One person from the household is randomly selected for inclusion in the survey. For analysis, the sample is weighted to adjust for differences in the probabilities of selection among subjects, stratified for differences between the age and sex structure of the sample and the Australian Bureau of Statistics mid-year population estimates for each area health service (excluding residents of institutions). This enables calculation of prevalence estimates for the state population rather than the respondents selected. Further information on the survey's probabilistic sampling, weighting procedures, and calculation of prevalence estimates, can be found elsewhere.[1,2]

Data are analysed using SAS version 9.[3] The SURVEYFREQ procedure is used to calculate prevalence estimates and 95% CI for the estimates. For pairwise comparison of subgroup estimates, the p-value for a two-tailed test is calculated using the normal distribution probability function PROBNORM.

Socioeconomic status is derived from the Index of Relative Socio-Economic Disadvantage,[4] which is based on a number of underlying variables such as family characteristics, household income, personal educational qualifications, employment status, and occupation profile. The index is grouped into 5 quintiles, with quintile 1 being the least disadvantaged and quintile 5 being the most disadvantaged. The survey assigns this index by postcode of residence.

In this report, the term urban means the respondent lived in 1 of the 4 area health services designated as metropolitan: Northern Sydney & Central Coast, South Eastern Sydney and Illawarra, Sydney South West, and Sydney West. The term rural means the respondent lived in 1 of the 4 area health services designated as rural: Greater Southern, Greater Western, Hunter & New England, and North Coast.

Studies demonstrate that a person's appraisal of his or her general health is a strong and independent predictor of future morbidity and mortality, even after controlling for physical and psychosocial and socioeconomic factors.[5] In the survey respondents aged 16 years and over are asked: Overall, how would you rate your health during the last 4 weeks: was it excellent, very good, good, fair, poor, or very poor? Responses of excellent, very good, and good are combined into a positive rating.

Alcohol consumption is measured against the Australian Alcohol Guidelines.[6] Risk drinking includes those who consumed alcohol every day, consumed more than 4 if male or 2 if female standard drinks per day, or consumed more than 6 if male or 4 if female standard drinks on any occasion in the last 4 weeks. High risk drinking includes those who consumed more than 11 if male or 7 if female standard drinks on any occasion in the last 4 weeks.

For breast cancer screening, the indicator excludes those who had an existing cancer or breast problem. For cervical cancer screening, the indicator excludes those who had a hysterectomy. For bowel cancer screening, the indicator excludes those who had been screened as part of follow-up treatment.

Adequate fruit and vegetable consumption is defined in the Australian Guide to Healthy Eating, the Dietary Guidelines for Children and Adolescents, and the Dietary Guidelines for Australian Adults. Recommended amounts vary within the 16-24 age range. For adolescents up to age 18 years, at least 3 serves of fruit and at least 4 serves of vegetables are recommended. From 18 years, at least 2 serves of fruit and at least 5 serves of vegetables are recommended. The recent 'Go for 2 and 5' Fruits and Vegetables Campaign conducted by national and state and other health authorities provides a simplified message that has been used as the basis for comparison in this survey.[7,8,9]

The Dietary Guidelines for Australian Adults state that people should limit the consumption of saturated fats, and choose foods that are low in salt, without making any specific recommendations.[8] However the National Food and Nutrition Monitoring and Surveillance Project recommends monitoring the percentage of the population that rarely or never eats fried potatoes, rarely or never eats salty snacks, and consumes meat products less than 3 times a week.[10]

The Dietary Guidelines for Australians recommends serves of cereals (including breads, rice, pasta, and noodles) based on age, sex, and individual circumstances.[11] For ease of respondent recall, the National Food and Nutrition Monitoring and Surveillance Project recommends breaking the cereals category into sub-categories: that is, collecting the frequency of consuming breads, cooked cereals, and breakfast cereals.[11] Thus the National Food and Nutrition Monitoring and Surveillance Project recommends comparing those who consume bread daily or more; rice, pasta, noodles and other cooked cereals daily or more; and breakfast cereals 2 or more times a week, with those who do not.

Adequate physical activity is derived from the National Physical Activity Guidelines for Adults, which recommend at least 30 minutes of moderate activity on most, and preferably all, days of the week, using questions asked in the Active Australia Survey. Adequate physical activity is defined as undertaking physical activity for a total of 150 minutes per week over 5 separate occasions.[12,13]

Psychological distress is derived from the K10 short screening scale, a 10-item questionnaire that measures non-specific psychological distress based on questions about the level of nervousness, agitation, psychological fatigue and depression in the most recent 4-week period. Responses to the questionnaire are classified into 4 categories: low psychological distress, when the K10 score is 10-15; moderate psychological distress, when the K10 score is 16-21; high psychological distress, when the K10 score is 22-29; and very high psychological distress, when the K10 score is 30 or higher. At both the population level and individual level the K10 measure is a barometer for psychological distress without identifying its cause.[14]

Overweight and obesity is derived from self-reported height and weight. Body Mass Index (BMI) is calculated by dividing a person's weight (in kilograms) by their height (in metres squared). The resulting BMI is classified into 4 categories: underweight when the BMI is less than 18.5, acceptable or ideal weight when the BMI is greater than or equal to 18.5 and less than 25, overweight when the BMI is greater than or equal to 25 and less than 30, and obese when the BMI is greater than or equal to 30. Although studies have shown self-reported BMI results in an under-estimation of measured BMI, it is still useful for ongoing surveillance of population health.

The table below shows that the 2006 weighted survey sample for persons aged 16-24 years compares well with the state population aged 15-24 years, according to the 2006 Census of Population and Housing, for sex, indigenous status, and full-time or part-time employment status.[15]

	Weighted Sample 2006 Survey (n=644) %	New South Wales Population 2006 Census (N=871,717) %
Sex		
Males	51.9	50.9
Females	48.1	49.1
Aboriginal or Torres Strait Islander		
Aboriginal and Torres Strait Islander origin	3.2	3.0
Highest level of school completed		
Never attended school	0.2	0.2
Year 8 or below	1.7	2.4
Year 9 or equivalent	2.0	9.7
Year 10 or equivalent (Intermediate)	18.2	23.0
Year 11 or equivalent	13.4	13.1
Year 12 or equivalent (Matriculation/Leaving)	64.5	51.6
Born in Australia		
Australia	79.4	72.9
Formal marital status		
Married	5.7	3.9
Widowed	0.0	0.1
Separated but not divorced	0.5	0.3
Divorced	0.7	0.2
Never married	93.1	95.6
Labour force status		
Employed Full-time (>=35 hours a week)	30.8	27.9
Employed Part-time (<35 hours a week)	27.3	24.0
Employed (on leave/hours not stated)	6.1	4.5
Unemployed	14.1	7.4
Not in the labour force	21.7	36.2

Health behaviours

Risk alcohol drinking

Between 1997 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who engaged in risk drinking behaviour (51.1 per cent to 45.3 per cent), as defined by the Australian Alcohol Guidelines. The decrease was significant among persons in the rural health areas (61.8 per cent to 48.1 per cent).

High risk alcohol drinking

Between 2002 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who engaged in high risk drinking behaviour (28.0 per cent to 18.7 per cent), as defined by the Australian Alcohol Guidelines. The decrease was significant among females (28.3 per cent to 15.9 per cent), among persons in the most disadvantaged quintile (30.6 per cent to 10.4 per cent), and among persons in the urban health areas (27.9 per cent to 17.3 per cent).

Injury prevention: smoke alarms in the home

Between 1997 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years who had a smoke alarm or detector installed in their home (54.4 per cent to 89.8 per cent). The increase was significant among persons in all quintiles of socioeconomic disadvantage, and among persons in the urban (51.5 per cent to 89.4 per cent) and rural (61.8 per cent to 91.0 per cent) health areas.

Nutrition

Between 1997 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years who ate the recommended 2 serves or more of fruit (43.1 per cent to 51.8 per cent). The increase was significant among females (45.3 per cent to 55.3 per cent), among persons in the most disadvantaged quintile (41.4 per cent to 56.9 per cent), and among persons in the urban health areas (43.6 per cent to 52.4 per cent).

Between 1997 and 2007, there has been no significant change in the proportion of persons aged 16-24 years who ate the recommended 5 serves or more of vegetables. However, there has been a significant decrease among persons in the most disadvantaged quintile (7.3 per cent to 2.7 per cent), and among persons in the rural health areas (8.6 per cent to 4.0 per cent).

Between 1997 and 2007, there has been no significant change in the proportion of persons aged 16-24 years who usually drank lower fat milks.

Between 2005 and 2007, there has been no significant change in the proportion of persons aged 16-24 years who ate potato crisps or salty snacks less than once a month.

Between 2002 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who ate breakfast cereal, breads, pasta, rice, or noodles once a day or more (96.4 per cent to 91.0 per cent). The decrease was significant among females (94.8 per cent to 86.0 per cent), among persons in the second quintile of disadvantage (96.9 per cent to 84.2 per cent), and among persons in the urban health areas (96.7 per cent to 90.6 per cent).

Between 1997 and 2007, there has been no significant change in the proportion of persons aged 16-24 years who ate processed meat products less than three times a week.

Physical activity

Between 1998 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who undertook adequate levels of physical activity, defined as 150 minutes of moderate activity a week over 5 separate occasions.

Current smoking

Between 1997 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who were current smokers (30.2 per cent to 17.7 per cent). The decrease was significant among males (31.3 per cent to 21.4 per cent) and females (29.2 per cent to 13.8 per cent), among persons in the first (or least disadvantaged) quintile (32.1 per cent to 8.2 per cent), the third quintile of disadvantage (31.1 per cent to 18.8 per cent), the fifth (or most disadvantaged) quintile (32.8 per cent to 21.7 per cent), and among persons in the urban health areas (29.5 per cent to 17.7 per cent) and rural health areas (30.2 per cent to 17.6 per cent).

Smoke-free households

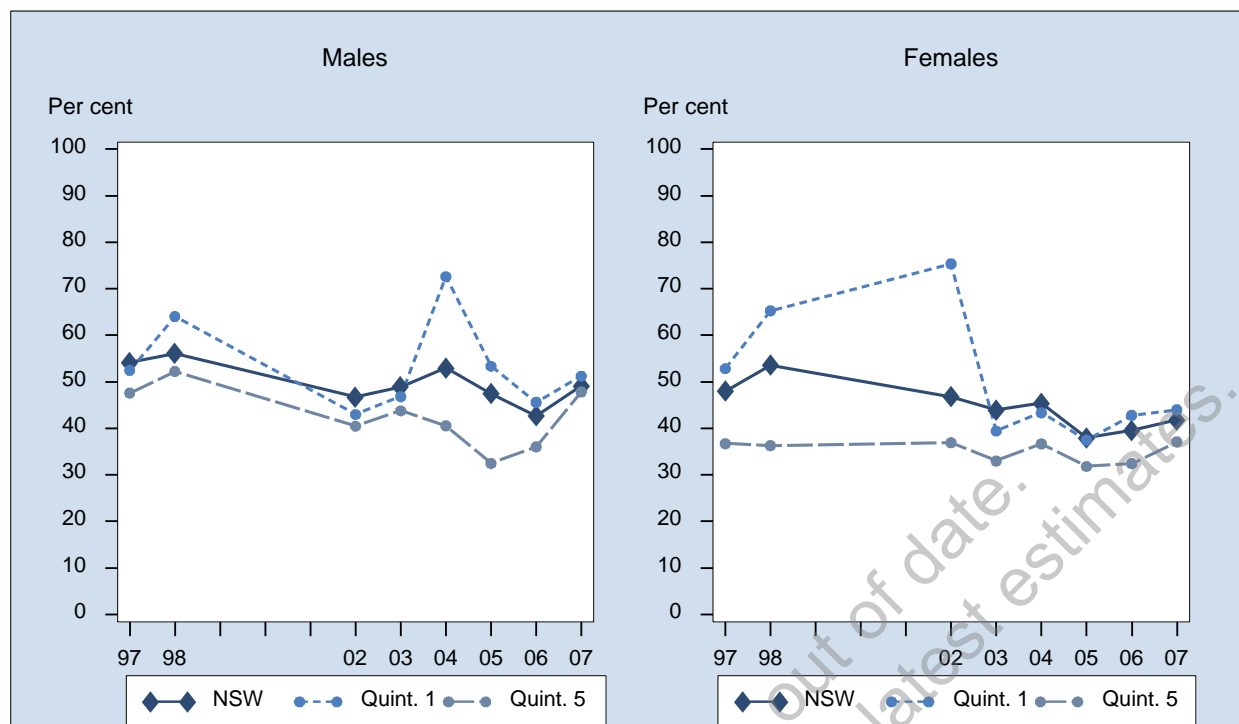

Between 1997 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years who lived in smoke-free households (62.3 per cent to 83.1 per cent). The increase was significant among males (65.0 per cent to 82.4 per cent) and females (59.4 per cent to 83.9 per cent), among persons in all quintiles of socioeconomic disadvantage, and among persons in the urban (62.1 per cent to 81.3 per cent) and rural (62.5 per cent to 87.5 per cent) health areas.

Smoke-free cars

Between 2003 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years over who had smoke-free cars (73.9 per cent to 83.1 per cent). The increase was significant among males (69.5 per cent to 81.3 per cent) and females (78.1 per cent to 85.0 per cent), among persons in all except the most disadvantaged quintile, and among persons in the urban (73.8 per cent to 82.7 per cent) and rural (74.1 per cent to 84.1 per cent) health areas.

	2007	47.6 (35.6-59.6)	41.7 (30.6-52.8)	51.7 (41.9-61.4)	45.6 (32.8-58.3)	41.7 (31.6-51.7)	45.3 (40.4-50.1)

Note: Estimates are based on the following numbers of respondents for NSW: 1997 (1,822), 1998 (1,653), 2002 (1,155), 2003 (1,239), 2004 (797), 2005 (912), 2006 (630), 2007 (569). The indicator includes those who exceed Guideline 1 of the NHMRC Australian Alcohol Guidelines, as 1 or more of the following: consuming alcohol every day, consuming on average more than [4 if male/2 if female] standard drinks, consuming more than [6 if male/4 if female] on any 1 occasion or day. The questions used to define the indicator were: How often do you usually drink alcohol? On a day when you drink alcohol, how many standard drinks do you usually have? In the last 4 weeks have you had more than [7-10 if male/5-6 if female] drinks in a day? and In the last 4 weeks how often have you had [11+ if male/7+ if female] drinks in a day? The questions used to define the 1997 and 1998 indicator were: How often do you have an alcoholic drink of any kind? On a day when you have alcoholic drinks, how many standard drinks do you usually have? and On the last occasion you had more than [4 if male/2 if female] drinks in a day, how many drinks did you actually have?

	2007	5.8 (3.1-8.6)	4.0 (1.4-6.5)	5.3 (3.2-7.4)

Note: Estimates are based on the following numbers of respondents for NSW: 1997 (1,863), 1998 (1,736), 2002 (1,163), 2003 (1,241), 2004 (812), 2005 (930), 2006 (635), 2007 (563). The indicator includes those who met the recommended consumption of vegetables. The recommended vegetable intake is 5 serves per day for persons aged 16 years and over. One serve is equivalent to 1/2 cup of cooked vegetables or one cup of salad vegetables. The question used to define the indicator was: How many serves of vegetables do you usually eat each day?

	2007	66.7 (52.8-80.6)	75.8 (64.6-87.0)	60.5 (49.2-71.7)	64.7 (52.6-76.8)	66.9 (55.4-78.5)	66.8 (61.5-72.1)

Note: Estimates are based on the following numbers of respondents for NSW: 1998 (1,745), 2002 (1,177), 2003 (1,254), 2004 (815), 2005 (928), 2006 (617), 2007 (409). The indicator includes those who did adequate physical activity. Adequate physical activity is a total of 150 minutes per week on 5 separate occasions. The total minutes were calculated by adding minutes in the last week spent walking continuously for at least 10 minutes, minutes doing moderate physical activity, plus 2 x minutes doing vigorous physical activity. The questions used to define the indicator were: In the last week, how many times have you walked continuously for at least 10 minutes for recreation or exercise or to get to or from places?, What do you estimate was the total time you spent walking in this way in the last week?, In the last week, how many times did you do any vigorous physical activity that made you breathe harder or puff and pant?, What do you estimate was the total time you spent doing this vigorous physical activity in the last week?, In the last week, how many times did you do any other more moderate physical activity that you have not already mentioned?

Health status

Self-rated health

Between 1997 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who rated their health positively as excellent, very good or good (91.6 per cent to 86.4 per cent). The decrease was significant among females (91.6 per cent to 83.6 per cent), among persons in the third quintile of disadvantage (92.6 per cent to 81.9 per cent), and among persons in the urban (91.7 per cent to 86.9 per cent) and rural (91.5 per cent to 85.3 per cent) health areas.

Asthma

Between 1997 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who had ever been told by a doctor or hospital they had asthma.

Between 1997 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who have current asthma (15.9 per cent to 11.5 per cent). The decrease was significant among females (19.5 per cent to 12.4 per cent), among persons in the third quintile of disadvantage (17.2 per cent to 9.6 per cent), and among persons in the urban health areas (15.7 per cent to 10.5 per cent).

Cardiovascular disease precursors

Between 1997 and 2005, there has been a significant increase in the proportion of persons aged 16-24 years who had their blood pressure measured in the last 2 years (71.3 per cent to 78.4 per cent). The increase was significant among males (63.4 per cent to 74.3 per cent), among persons in the third quintile of disadvantage (68.4 per cent to 82.2 per cent), and among persons in the rural health areas (68.2 per cent to 81.2 per cent).

Between 1997 and 2005, there has been a significant increase in the proportion of persons aged 16-24 years who had ever been told by a doctor or hospital they had high blood pressure (1.6 per cent to 6.9 per cent). The increase was significant among males (2.0 per cent to 5.1 per cent) and females (1.2 per cent to 8.7 per cent), among persons the second quintile (2.4 per cent to 8.3 per cent) and fifth or most disadvantaged quintile (1.1 per cent to 10.0 per cent), and among persons in the urban and rural health areas.

Between 1997 and 2005, there has been a significant increase in the proportion of persons aged 16-24 years who had their cholesterol measured in the last 2 years (18.7 per cent to 23.0 per cent). The increase was significant among persons in the fifth or most disadvantaged quintile (16.9 per cent to 32.4 per cent).

Between 1997 and 2005, there has been no significant variation in the proportion of persons aged 16-24 years who had ever been told by a doctor or hospital they had high cholesterol. However, there has been a significant decrease among persons in the second quintile of disadvantage (11.5 per cent to 1.5 per cent) and the fifth or most disadvantaged quintile (10.2 per cent to 2.4 per cent).

Diabetes or high blood glucose

Between 1997 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who had ever been told by a doctor or hospital they had diabetes or high blood glucose.

Mental health

Between 1997 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years with high or very high psychological distress according to the K10 measure.

Oral health

Between 2002 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who visited a dental professional in the last 12 months. However, there was a significant decrease among males (56.5 per cent to 43.9 per cent), among persons in the fourth quintile of disadvantage (58.9 per cent to 45.3 per cent), and among persons in the rural health areas (60.5 per cent to 48.4 per cent).

Overweight or obese

Between 1997 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who were either overweight or obese, with a BMI of 25 or above calculated from self-reported height and weight. However, there was a significant increase among persons in the fifth or most disadvantaged quintile (25.4 per cent to 37.9 per cent), and among persons in the rural health areas (25.0 per cent to 35.6 per cent).

Between 1997 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years who were obese, with a BMI of 30 or above calculated from self-reported height and weight (4.0 per cent to 8.7 per cent). The increase was significant among females (2.7 per cent to 9.9 per cent), among persons in the fifth or most disadvantaged quintile (6.3 per cent to 14.3 per cent), and among persons in the urban (3.2 per cent to 7.4 per cent) and rural (6.1 per cent to 11.8 per cent) health areas.

	2007	88.8 (83.1-94.4)	88.5 (83.1-93.9)	81.9 (76.1-87.8)	87.3 (81.9-92.7)	86.9 (81.2-92.7)	86.4 (83.9-89.0)

Note: Estimates are based on the following numbers of respondents for NSW: 1997 (1,867), 1998 (1,745), 2002 (1,176), 2003 (1,254), 2004 (814), 2005 (937), 2006 (644), 2007 (893). The indicator includes those responding excellent, very good, or good to a global self-rated health status question. The question used to define the indicator was: Overall, how would you rate your health during the last 4 weeks? Was it excellent, very good, good, fair, poor, or very poor? The question used to define the indicator in 1997 and 1998 was: In general would you say your health is excellent, very good, good, fair, or poor?

	2003	83.0 (79.8-86.2)	87.2 (83.9-90.5)	84.2 (81.7-86.7)
	2004	83.8 (79.6-87.9)	85.7 (81.1-90.3)	84.3 (81.0-87.6)
	2005	84.5 (81.1-88.0)	84.6 (80.4-88.7)	84.6 (81.8-87.3)
	2006	81.9 (77.7-86.2)	89.2 (85.0-93.3)	83.9 (80.6-87.2)
	2007	86.9 (83.8-90.0)	85.3 (81.1-89.4)	86.4 (83.9-89.0)

Note: Estimates are based on the following numbers of respondents for NSW: 1997 (1,867), 1998 (1,745), 2002 (1,176), 2003 (1,254), 2004 (814), 2005 (937), 2006 (644), 2007 (893). The indicator includes those responding excellent, very good, or good to a global self-rated health status question. The question used to define the indicator was: Overall, how would you rate your health during the last 4 weeks? Was it excellent, very good, good, fair, poor, or very poor? The question used to define the indicator in 1997 and 1998 was: In general would you say your health is excellent, very good, good, fair, or poor?

Note: Estimates are based on the following numbers of respondents for NSW: 1997 (1,757), 1998 (1,599), 2002 (1,098), 2003 (1,184), 2004 (765), 2005 (895), 2006 (607), 2007 (556). The indicator includes those who are overweight or obese ie with a Body Mass Index (BMI) of 25 or higher. The questions used to define the indicator were: How tall are you without shoes? and How much do you weigh without clothes or shoes? BMI is calculated as follows: BMI = weight (kg)/height²(m). Categories for this indicator include overweight (BMI from 25 to 29.9) and obese (BMI of 30 and over).

	2006	28.5 (23.2-33.8)	27.0 (20.3-33.8)	28.1 (23.8-32.4)
	2007	22.3 (17.1-27.5)	35.6 (27.8-43.3)	26.1 (21.7-30.5)

Note: Estimates are based on the following numbers of respondents for NSW: 1997 (1,757), 1998 (1,599), 2002 (1,098), 2003 (1,184), 2004 (765), 2005 (895), 2006 (607), 2007 (556). The indicator includes those who are overweight or obese ie with a Body Mass Index (BMI) of 25 or higher. The questions used to define the indicator were: How tall are you without shoes? and How much do you weigh without clothes or shoes? BMI is calculated as follows: BMI = weight (kg)/height²(m). Categories for this indicator include overweight (BMI from 25 to 29.9) and obese (BMI of 30 and over).

Health services

Health service use and access

Between 1997 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years with private health insurance (35.1 per cent to 45.6 per cent). The significant increase was among males (35.3 per cent to 45.6 per cent) and females (34.9 per cent to 45.7 per cent), among persons in all except the fifth or most disadvantaged quintile, and among persons in the urban health areas (35.8 per cent to 47.6 per cent).

Between 1997 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years who had difficulties getting health care when needing it (5.7 per cent to 9.9 per cent). The significant increase was among males (5.1 per cent to 9.1 per cent) and females (6.4 per cent to 10.6 per cent), among persons the third quintile of disadvantage (5.9 per cent to 13.6 per cent), and among persons in the rural health areas (8.2 per cent to 17.9 per cent).

Emergency department presentations

Between 1997 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who presented to an emergency department on 1 or more occasions in the last 12 months.

Hospital admissions

Between 1997 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who were admitted to hospital on 1 or more occasions in the last 12 months. However, there has been a significant increase among persons in the third quintile of disadvantage (10.1 per cent to 18.9 per cent) and among persons in the rural health areas (11.3 per cent to 19.4 per cent).

General practitioner visits

Between 1997 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who visited a general practitioner in the last 2 weeks. However, there has been a significant decrease among males (20.5 per cent to 11.2 per cent), and among persons in the second quintile of disadvantage (25.1 per cent to 12.6 per cent).

Between 1997 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who visited a general practitioner in the last 12 months (88.3 per cent to 71.3 per cent). The significant decrease was among males (84.8 per cent to 65.0 per cent) and females (91.9 per cent to 77.6 per cent), among persons in all quintiles of disadvantage, and among persons in the urban (88.8 per cent to 70.9 per cent) and rural (86.9 per cent to 72.3 per cent) health areas.

Public dental services

Between 2002 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years who attended a public dental service in the last 12 months (8.8 per cent to 12.7 per cent). The significant increase was among males (6.8 per cent to 13.5 per cent), among persons the fifth or most disadvantaged quintile (5.2 per cent to 16.1 per cent), and among persons in the rural health areas (9.6 per cent to 16.1 per cent).

Community health centres

Between 2002 and 2007, there has been a significant increase in the proportion of persons aged 16-24 years who attended a community health centre in the last 12 months (8.9 per cent to 13.0 per cent). The significant increase was among persons in the third quintile (6.9 per cent to 16.1 per cent) and fifth or most disadvantaged quintile (5.7 per cent to 16.4 per cent), and among persons in the rural health areas (10.5 per cent to 16.6 per cent).

	2007	11.5 (8.1-14.9)	16.6 (11.8-21.4)	13.0 (10.2-15.8)

Note: Estimates are based on the following numbers of respondents for NSW: 2002 (1,173), 2003 (1,251), 2004 (813), 2005 (934), 2006 (641), 2007 (798). The indicator includes those who attended a community health centre in the last 12 months. The question used to define the indicator was: In the last 12 months, have you attended a government-run community health centre?

Social capital

Participation in the local community

Between 2002 and 2006, there has been no significant variation in the proportion of persons aged 16-24 years who attended a community event at least once in the last 6 months.

Between 2002 and 2006, there has been no significant variation in the proportion of persons aged 16-24 years who helped out a local group or organisation at least once in the last 3 months.

Between 2002 and 2006, there has been no significant variation in the proportion of persons aged 16-24 years who were active members of a local organisation or church or club.

Trust and safety

Between 2002 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who felt most people can be trusted. However, there has been a significant increase among females (54.9 per cent to 63.0 per cent).

Between 2002 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who felt safe walking down their street after dark (74.9 per cent to 67.6 per cent). The significant decrease was among males (85.1 per cent to 75.9 per cent), among persons in the second quintile (81.0 per cent to 61.3 per cent) and fourth quintile (79.0 per cent to 64.5 per cent) of disadvantage, and among persons in the urban health areas (73.6 per cent to 65.1 per cent).

Between 2002 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who said their area had a reputation for being safe. However, there has been a significant decrease among males (74.7 per cent to 65.9 per cent), and among persons in the urban health areas (69.7 per cent to 61.4 per cent).

Reciprocity and neighbourhood connectedness

Between 2002 and 2007, there has been a significant decrease in the proportion of persons aged 16-24 years who visited neighbours in the last week (70.5 per cent to 63.6 per cent).

Between 2002 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who ran into friends and acquaintances while shopping locally.

Between 2002 and 2007, there has been no significant variation in the proportion of persons aged 16-24 years who would feel sad if they had to leave their neighbourhood. However, there was a significant decrease among persons in the second quintile of disadvantage (77.5 per cent to 64.1 per cent), and a significant increase among persons in the fourth quintile of disadvantage (60.1 per cent to 73.6 per cent).

Please check the data for late estimates.

Active member of a local organisation, church or club by region, persons aged 16 to 24 years, NSW, 2002-2006

Sex	Year	Urban % (95% CI)	Rural % (95% CI)	NSW % (95% CI)
Males	2002	41.2 (34.7-47.8)	49.3 (40.0-58.6)	43.6 (38.2-49.0)
	2003	46.1 (39.6-52.6)	51.8 (44.7-58.8)	47.8 (42.7-52.8)
	2005	41.8 (34.9-48.6)	50.9 (42.4-59.5)	44.2 (38.6-49.7)
	2006	40.7 (32.7-48.7)	49.9 (39.0-60.8)	43.2 (36.6-49.8)
Females	2002	35.7 (29.4-41.9)	40.8 (33.4-48.2)	37.1 (32.2-42.1)
	2003	31.0 (25.4-36.7)	37.6 (30.1-45.1)	32.8 (28.1-37.4)
	2005	41.3 (34.7-47.9)	35.9 (28.8-42.9)	39.8 (34.7-45.0)
	2006	34.4 (27.0-41.8)	39.3 (30.1-48.5)	35.7 (29.7-41.7)
Persons	2002	38.5 (33.9-43.1)	45.2 (39.2-51.1)	40.4 (36.7-44.1)
	2003	37.8 (33.5-42.1)	45.4 (40.3-50.6)	39.9 (36.5-43.3)
	2005	41.5 (36.8-46.3)	43.2 (37.7-48.7)	42.0 (38.2-45.8)
	2006	37.6 (32.2-43.1)	44.8 (37.6-52.1)	39.6 (35.1-44.1)

Note: Estimates are based on the following numbers of respondents for NSW: 2002 (1,177), 2003 (1,253), 2005 (936), 2006 (644). The indicator includes those who are an active member of a local organisation, church or club. The question used was: Are you an active member of a local organisation, church or club, such as a sport, craft, or social club?

Conclusion

The New South Wales Population Health Survey began as a continuous survey in 2002, following adult health surveys in 1997 and 1998, and an older people's survey in 1999. Most indicators are collected and reported annually but some are collected and reported biennially and triennially. Data are collected on demographics, health behaviours, health status, use of and satisfaction with health services, and social capital. Some of these indicators are highlighted below for people aged 16-24 years.

Trends in health behaviours

Health behaviours influence health and wellbeing. There have been significant changes in some indicators of health behaviour, while other indicators have not changed significantly.

There have been increases in smoke alarms in the home, adequate fruit consumption, smoke-free households, and smoke-free cars.

There have been decreases in risk alcohol drinking, high risk alcohol drinking, consumption of cereals or breads or pasta or rice or noodles, and current smoking.

There have been no changes in adequate vegetable consumption, consumption of lower fat milks, consumption of potato crisps or salty snacks, consumption of processed meat products, and adequate physical activity.

Trends in health status

Monitoring the health status of a population helps detect emerging patterns of illness and disease and provides information to inform health policy and planning of health services. There have been significant changes in some indicators of health status, while other indicators have not changed significantly.

There have been increases in blood pressure measured in the last 2 years, high blood pressure, cholesterol measured in the last 2 years, and obesity (a BMI of 30 or over calculated from self-reported height and weight).

There have been decreases in self-rated health and current asthma.

There have been no changes in ever had asthma, high cholesterol, diabetes or high blood glucose, psychological distress, visits to a dental professional in the last 12 months, and overweight and obese (a BMI of 25 or over calculated from self-reported height and weight).

Trends in health services

Information about the use of health services assists in formulating health policy and health service planning. There have been significant changes in some health service indicators, while other indicators have not changed significantly.

There have been increases in private health insurance, difficulties getting health care, use of public dental services, and use of community health centres.

There have been decreases in visits to a general practitioner in the last 12 months.

There have been no changes in emergency department presentations, hospital admissions, and visits to a general practitioner in the last 2 weeks.

Trends in social capital

Social capital is created from the everyday interactions between people. It is called capital because it can be measured and quantified in a way that can distribute its benefits and avoid its losses. There have been significant changes in some indicators of social capital, while other indicators have not changed significantly.

There have been decreases in people feeling safe walking down their street after dark and visiting neighbours in the last week.

There have been no changes in people attending a community event in the last 6 months, helping out at a local group or organisation in the last 3 months, who were active members of a local organisation or church or club, who felt most people can be trusted, who felt their area has a reputation for being safe, who ran into friends and acquaintances while shopping locally, and who would feel sad if they had to leave their neighbourhood.

The future

The collection and reporting plan for the New South Wales Population Health Survey to 2012 can be found at www.health.nsw.gov.au/public-health/survey/hsurvey.html. The continued monitoring of indicators via the Survey will provide information to assist health professionals, health service planners and those involved in development of health policy for persons aged 16-24 years.

WARNING: Estimates are out of date.
Please check HealthStats NSW for latest estimates.

Trends in health behaviours

Indicator	Year	Persons aged 16 to 24 years			Persons aged 16 years and over		
		Males	Females	Persons	Males	Females	Persons
